

## CLAIMS

1. A directional sound processing system, comprising:

5 at least first and second microphones spaced apart by a distance, said first microphone producing a first electronic sound signal and said second microphone producing a second electronic sound signal;

10 a noise level estimate circuit operatively coupled to said first or second microphone, said noise level estimate circuit operates to produce a noise level estimate associated with the first or second electronic sound signal from said first or second microphone; and

15 a directional processing circuit operatively connected to said first and second microphones and said noise level estimate circuit, said directional processing circuit operates to activate or deactivate directional processing with respect to the first and second electronic sound signals based on the noise level estimate.

20 2. A directional sound processing system as recited in claim 1, wherein when the noise level estimate is less than a threshold amount, said directional processing circuit deactivates the directional processing.

3. A directional sound processing system as recited in claim 1,

25 wherein when the noise level estimate is less than a first threshold amount, said directional processing circuit deactivates the directional processing, and

wherein when the noise level estimate is greater than a second threshold amount, said directional processing circuit activates the directional processing.

8. A directional sound processing system as recited in claim 6,  
wherein the control signal is a scaling signal, and  
wherein said signal modification circuit is a multiplication circuit that  
multiplies the second electronic sound signal with the control signal.

5

9. A directional sound processing system as recited in claim 6, wherein the  
control signal is one of a logical "1" and a logical "0".

10

10. A directional sound processing system as recited in claim 6, wherein  
said combining circuit is a subtraction circuit.

15

11. A directional sound processing system as recited in claim 1, wherein  
said directional sound processing system further comprises:

a delay circuit that delays the second electronic sound signal by a delay  
amount.

12. A directional sound processing system as recited in claim 1, wherein  
said directional processing circuit comprises:

20

a directional processing control circuit operatively coupled to said noise  
level estimate circuit, said directional processing control circuit operates to  
produce a control signal based on the noise level estimate and at least one  
threshold; and

25

a scaling circuit operatively connected to said directional processing  
control circuit, said scaling circuit operates to scale the second electronic sound  
signal in accordance with the control signal; and

a subtraction circuit operatively connected to said scaling circuit and said  
first microphone, said subtraction circuit operates to produce an output  
difference signal by subtracting the scaled second electronic sound signal from  
the first electronic sound signal.

13. A directional sound processing system as recited in claim 12, wherein said directional sound processing system further comprises:

5 a delay circuit that delays the second electronic sound signal or the scaled second electronic sound signal by a delay amount.

14. A directional sound processing system as recited in claim 1, wherein said directional sound processing system resides within a hearing aid device.

10 15. A directional sound processing system, comprising:

at least first and second microphones spaced apart by a distance, said first microphone producing a first electronic sound signal and said second microphone producing a second electronic sound signal;

15 a minimum estimate circuit operatively coupled to said first or second microphone, said minimum estimate circuit produces a minimum estimate for the first or second electronic sound signal from said first or second microphone;

a directional processing control circuit operatively coupled to said minimum estimate circuit, said directional processing control circuit produces a control signal based on the minimum estimate; and

20 a scaling circuit operatively connected to said directional processing control circuit, said scaling circuit operates to scale the second electronic sound signal in accordance with the control signal; and

25 a subtraction circuit operatively connected to said scaling circuit and said first microphone, said subtraction circuit producing an output difference signal by subtracting the scaled second electronic sound signal from the first electronic sound signal.

16. A directional sound processing system as recited in claim 15, wherein said directional sound processing system further comprises:

a delay circuit that delays the second electronic sound signal or the scaled second electronic sound signal by a delay amount.

17. A directional sound processing system as recited in claim 15, wherein  
5 said scaling circuit comprises a multiplier.

18. A directional sound processing system as recited in claim 15, wherein  
said directional sound processing system resides within a hearing aid device.

19. In a hearing aid device having a multi-microphone sound processing  
10 device, a method for dynamically controlling directional processing in the multi-  
microphone sound processing system, said method comprising:

(a) receiving first and second electronic sound signals from first and  
second microphones, respectively;

15 (b) producing a differential electronic sound signal based on the first and  
second sound signals when an estimated noise level is greater than a first  
threshold; and

(c) alternatively producing a non-differential sound signal based on the  
first and second sound signals when the estimated noise level is less than  
20 greater than a second threshold.

20. A method as recited in claim 19, wherein the first threshold is greater  
than or equal to the second threshold.

25 21. A method as recited in claim 19, wherein the first and second  
microphones are provided within a hearing aid device, and wherein said  
method is performed by the hearing aid device.

22. A method for dynamically controlling directional processing in the multi-microphone sound processing system, said method comprising:

(a) receiving first and second electronic sound signals from first and second microphones, respectively;

5 (b) estimating a noise level picked up by at least one of the first and second microphones; and

(c) dynamically controlling the directional processing based on the estimated noise level.

10 23. A method as recited in claim 22, wherein said controlling (c) comprises:

(c1) comparing the estimated noise level to at least one threshold level to produce a directional processing control signal; and

(c2) controlling the directional processing in accordance with the directional processing control signal.

15

24. A method as recited in claim 23, wherein said controlling (c2) comprises scaling one of the first and second electronic sound signals processing in accordance with the directional processing control signal.

20 25. A method as recited in claim 22, wherein said controlling (c) comprises:

(c1) comparing the estimated noise level to a threshold level to produce a comparison signal; and

(c2) deactivating the directional processing when the estimated noise level is below the threshold level.

25

26. A method as recited in claim 22, wherein said controlling (c) comprises:

(c1) comparing the estimated noise level to a first threshold level to produce a first comparison signal;

54B  
A1

(c2) comparing the estimated noise level to a second threshold level to produce a second comparison signal, the second threshold level being greater than the first threshold level;

5 (c3) deactivating the directional processing when the estimated noise level is below the first threshold level; and

(c4) activating the directional processing when the estimated noise level is greater than the second threshold level.

27. A method as recited in claim 26, wherein the second threshold level is  
10 greater than the first threshold level.

28. A method as recited in claim 22, wherein the first and second  
microphones are provided within a hearing aid device, and wherein said  
method is performed by the hearing aid device.

15 29. A method as recited in claim 22, wherein the noise level is estimate by a  
minimum estimator.
